Saeed Jalali

Senior Backend Developer

saeedjalalisj@gmail.com | LinkedIn | GitHub

SUMMARY

Senior Backend / Software Developer with 7+ years designing and scaling backend systems across financial and e-commerce platforms, using Go, Node.js, and TypeScript. Known for taking full ownership of complex, business-critical systems — from architecture through delivery — and for consistently leaving them faster and cheaper to run than he found them. Acts as a team's go-to backend authority: leading code reviews, shaping technical decisions, and raising testing standards. An early adopter of AI-native development (Cursor, Claude, OpenCode), using it to move faster without cutting corners on quality.

SKILLS

Languages & Backend: Go, Node.js, TypeScript, JavaScript, PHP

Databases & APIs: PostgreSQL, MySQL, MongoDB, Redis, gRPC, REST

Architecture & Practices: Domain-Driven Design, Clean Architecture, Microservices, BDD (Gherkin/Cucumber), CI/CD, Code Review

Infra & Tools: Docker, RabbitMQ, Traefik, Git, Linux (Ubuntu, Manjaro)

AI-Assisted Development: Cursor, Claude, OpenCode, Prompt Engineering

WORK EXPERIENCE

Senior Backend Developer — System Group *Nov 2023 – Present*

- Own business-critical features with complex domain logic across the Financial and Cost Accounting modules of a 100+ engineer ERP platform serving 400+ active users, from technical design through delivery.
- Reduced resource usage by up to 40% on high-traffic features such as Excel import/export by redesigning backend logic and optimizing PostgreSQL queries.
- Improved the design and review of complex financial queries and reports, increasing report generation speed and cutting resource consumption by up to 15%.
- Designing and developing the Cost Accounting Management module end-to-end, currently in active implementation.
- Built and maintained BDD test coverage (Gherkin/Cucumber) to validate business requirements and catch regressions before production; serve as technical owner leading code reviews and driving architecture decisions.
- Built an AI-powered internal agent to investigate flaky tests and cut manual investigation effort; apply AI-native workflows (Cursor, Claude, OpenCode) across implementation, refactoring, and code review.

Software Engineer — Part Group *Apr 2022 – Nov 2023 (2 yr 10 mo)*

- Built Nest.js microservices integrating with machine learning APIs, improving system efficiency and reducing latency for downstream services.
- Introduced CI/CD practices for the team, shortening release cycles and improving software quality.
- Optimized microservices to handle production workloads of up to 18,000 requests/day; diagnosed and resolved resource contention and memory leaks, cutting required compute resources by ~30%.

EARLIER EXPERIENCE

Software Engineer — Honari *Feb 2020 – Mar 2021*

Maintained e-commerce backend APIs (PHP/MySQL); improved order-processing throughput by 25% and cut query times by 50% via caching and indexing.

Software Engineer — Kamva.ir *Nov 2017 – Jan 2020*

Rebuilt an e-commerce platform's frontend in React (-40% load time) and built an internal admin portal for inventory, order, and customer management.

Freelance Software Engineer — Self-Employed *Apr 2021 – Nov 2021*

Built a document management platform with a Node.js/Express REST API, replacing a manual departmental workflow.

EDUCATION

B.Sc. Information Technology — Islamic Azad University, Tehran South Branch | *Graduated 2020*
